The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metaetasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, necolar degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Oaler-Webber Syndrome, mycoardial angiogenesis, plaque neovascularisation, telangiectasia, haemophilac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclarosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention.
                                                                                             Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 18 BP; 0 A; 0 C; 0 G; 18 T; 0 other;

Increasing efficiency of second strand cDNA synthesis using terminal continuation model before performing further RNA amplification by RNA transcription

Example 7; Page 80; 128pp; English.

This invention relates to a novel method for increasing the efficiency of second strand cDNA synthesis through a mechanism of terminal continuation. In the method an RNA molecule is obtained and a first primer is added that comprises a region that hybridises to a complementary region of the molecule before a second primer is added comprising at least one riboguanine at the 3' end of the primer. A first

```
complementary nucleic acid molecule is synthesised, the RNA molecule and second primer are removed and a second complementary nucleic acid molecule is synthesised to form a second hybrid with an extension product of the third primer bound to the first complementary molecule. The method of the invention is useful for increasing the efficiency of genetic signals from histologically stained tissue. The present expresents a poly d(T) PCR primer used in the method of the
                                                                                                                                                                                                         invention.

Novel polypeptide having cytotoxic activity obtainable from Aplysia, useful for destroying tumors, for identifying novel targets for the development of anti-tumor agents, and as specific ion channel modulators

Example 5; Page 37; 87pp; English.

The present invention relates to novel polypeptides having cytotoxic activity obtainable from sea hare Aplysia. Sequences of the invention activity obtainable from sea hare Aplysia. Sequences of the invention resistant for the manufacture of cytotoxic agents against apoptosis-resistant cells, where the agents are useful for diagnosis, prevention, treatment of disorders associated with dysfunctions of GAP-SH3 binding protein, factors for generating or detoxifying reactive oxygen species (ROS) and factors for blocking and/or by-passing of caspases. They are useful for tumour therapy. Cytotoxic proteins of the invention are useful for tumour therapy. Cytotoxic proteins of the invention are useful for tumour therapy or selectively killing cells in tissues, for identifying novel targets for the development of pharmaceutical agents, preferably anti-tumour agents and as specific ion channel modulators, e.g., blockers or openers for therapy, diagnostic or research. They are useful for the diagnosis and therapy of hyperproliferative diseases,

preferably tumours, e.g., leukaemia, carcinoma, sarcoma and melanoma. They are also useful for development of drugs for the treatment of degenerative diseases such as Alzheimer's disease, Parkinson's disease, arteriosclerosis, heart diseases, stroke and vascular diseases. The present sequence is an oligomucleotide which is used for amplifying sea hare cyplasin L DNA. This sequence is used in the exemplification the invention.

Novel secreted factor polypeptide useful for treating cardiac diseases such as arteriosclerosis, myocardial infarction, inflammatory diseases such as asthma, stroke, and rheumatoid arthritis and renal diseases

Example 1; Page 51; 189pp; English.

The invention relates to rat secreted factor polypeptides and the polynucleotides encoding them. The sequences are useful for treating cardiac, renal or inflammatory diseases. These include cardiac diseases such as congestive heart failure, myocarditis, dilated congestive cardiamyopathy, angina pectoris, myocardial infarction, cardiac arrhythmia, pulmonary hypertension, arteriosclerosis, atherosclerosis and cardiac tumours, renal diseases such as glomerulonophritis, nephrotic syndrome, renal infarction, hereditary nephritis, polycystic kidney disease, chronic renal failure, renal vein thromboeis and medullary sponge kidney and inflammatory diseases such as asthma, rheumatoid

The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises: (a) CDNAs obtained by transcribing respectively from at least two tissue RNAs are respectively fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from the same or different tissues by the step (a); (c) the resultant adaptoradded cDNAs are mixed together; (d) an adaptor primer having the common sequence to said different adaptor and a gene-specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from polyadenylic acid of the mRNA before the addition of the adaptor among the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the cONA amounts are measured between the tissues; (f) the RNA is detected from the measured result; (g) each different adaptor and a common adaptor are added to each of the genomic DNA fragments derived from a same or mind a common adaptor and a commo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mixed together; (i) the adaptor-added genomic DNAs are amplified by using an adaptor primer having the common sequence to the different adaptor and sequence specific adaptor; and (j) the ratios of the amplified amounts of the genomic DNAs are measured between the individuals. The method is used for the detection of the amounts of RNA and DNA. The present sequence represents an oligonucleotide which is used in the exemplification of the present invention.
the amounts of RNA and DNA

The present invention relates to methods for treating or preventing cancer, involving administrating to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, boan center, brain and central nervous system (CNS) cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, Hodgkin's lymphoma, cancer, laukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, non-Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, stomach cancer, prostate cancer, rhabdomyosarcoma, skin cancer, stomach cancer, prostate cancer, and uterine cancer. The present sequence is an immunostimulatory oligonuclectide described in the exemplification of the invention

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7578) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q7598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-scranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes
                                                                                                              Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression

cDNA and gene expression - by amplification of mRNA digestion with restriction enzymes
      WPI; 1995-018287/03
               Analysis of
followed by
```

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQVIS4T-07579) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19 BP; 0 A; 0 C; 2 G; 17 T; 0 other;

Sosnowski RG,

The sequences given in AAT10742-67 are synthetic oligonucleotides which are used in the construction of the electronically self-addressable device (ED) of the invention. The ED comprises a substrate, an electrode or opt. a number of electrodes supported by

the substrate, a current source operatively connected to the electrode and an attachment layer adjacent to the electrode which is permeable to a counterion but not permeable to a molecule capable of insulating or binding to the electrode. The attachment layer is capable of attaching a macromolecule. The ED is used for genetic typing and comprises a number of electronically addressable locations each comprising an electrode, and a binding entity, such as one of these probes, attached to each of the locations capable of detecting the presence of a genetic sequence. 888888888888888

New aminooxy-modified oligonucleotides - which can show improved binding to complementary strands and improved resistance to nuclease

Disclosure; Page 84; 131pp; English.

The invention relates to aminooxy-modified(oligo)nucleotides or nucleosides which are useful as therapeutics, diagnostics, and research reagents. They may be used, e.g., for modulation of the ras gene and may be able to modulate the process of transformation from normal to malignant cell growth. They may be prepared using known methods. Inclusion of the aminooxy moieties can improve binding of oligonucleotides to complementary strands. The moieties can also provide conjugation sites useful for conjugation of useful ligands (e.g. reporter pharmacodynamic properties) to oligonucleotides. The present sequence represents an example of an aminooxy-modified oligonucleotide disclosed in the specification.

ô
The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate specific Barly-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic
                                                                                                                                                                                                                                                                                                                     procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The specification describes an enzyme-specific cleavable polymucleotide substrate bearing quenched fluorescent moieties. The enzyme-specific cleavable polymucleotide substrate is useful in biological assays for detection and identification of microorganisms, sterilization assurance, biological assays. The method provides a rapid and convenient approach for detection and identification of microorganisms. It can be adapted to sequence-dependent or sequence-independent tests. The invention provides improved accuracy, faster detection, and overall lower cost in detection and identification of microorganisms. The presence of nuclease is measured more accurately and sensitively by red-shifting the emission wavelength from far UV region (350-400 mm) to the 500-600 mm region of the electromagnetic spectrum and reducing the effect of background signal converse of the inventor sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the invention.

The specification describes a self-addressable, self-assembling microelectronic device which is designed to actively carry out and control multi-step and multiplex molecular biological reactions in microscopic formats. A key aspect of this inventions is played by the ion-permeable permeation layer which overlies the electrode. This permeation layer allows attachment of nucleic acids to permit immobilization but also separates the attached oligonucleotides and hybridized target DNA sequences from the highly reactive electrochemical environment generated immediately at the electrode surface. The microelectronic device is designed and fabricated to actively carry out and control reactions such as nucleic acid hybridizations,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibody/antigen reactions, sample preparation, diagnostics and biopolymer synthesis. The device can electronically control the transport and attachment of specific binding entities, such as nucleic acids and polypeptides, to specific micro-locations. The device can subsequently control the transport and reaction of analytes or reactants at the addressed specific micro-locations. The device is able to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          concentrate analytes and reactants, remove non-specifically bound molecules, provide stringency control for DNA hybridization reactions

It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for geometry allows the oligonucleotide acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotides containing sequences with A and B geometry, used to treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA.

New oligonucleotides containing sequences with A and B geometry, used to treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNABSE-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide ISIS 22111 contains a phosphodiester backbone and has 2'.-0'.(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form

affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide, nuclease resistance, psoriasis, antipsoriatic, dermatological, cytostatic, virucide, antibacterial, fungicide, therapy, diagnosis, DNA-RNA hybrid, ss.
to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonuclectides. Novel oligonuclectides of the invention have both A- and B-form

Oligonucleotide ISIS 22113 contains a phosphorothioate backbone and has 2'-0-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for Rhass-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications.
                                         New oligonucleotides containing sequences with A and B geometry, user to treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide; nuclease resistance; psoriasis; antipsoriatic; dermatological; cytostatic; virucide; antibacterial; fungicide; therapy; diagnosis; ss.

Oligonuclectide ISIS 22114 contains a mixed phosphodiester and phosphorothicate backbone and has 3'-0-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of cligonuclectides. Novel oligonuclectides of the invention have both A - and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonuclectide. The B-form geometry allows the oligonuclectide to serve as substrate for Rhase-H when bound to a target nucleic acid strand. The oligonuclectides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and
                                                                                                                                                                New oligonucleotides containing sequences with A and B geometry, user
to treat and diagnose e.g. psoriasis, skin cancers and viral, fungal
and bacterial infections, bind to single stranded RNA or DNA -

oligonuclectides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonuclectide. The B-form geometry allows the oligonuclectide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The inflammatory skin conditions, skin cancers and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New oligonucleotides containing sequences with A and B geometry, user to treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Il9 diester; nuclease stability assay; polymerase chain reaction; PCR; molecular cloning; disease diagnosis; disease treatment; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents 2'-modified chimeric oligonucleotides containing 2'-modified T. The nucleotides were used to examine the effects of the modifications on nuclease resistance. Novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide ISIS 22115 contains a mixed phosphodiester and phosphorothioate backbone and has 2'-0-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of cligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the cligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligonucleotides containing sequences with A and B geometry, used to treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                The present invention is concerned with methods of determining the nuclease stability of oligomeric compounds using capillary-gel electrophoresis and laser-induced fluorescence. The methods are useful in the polymerase chain reaction (PCR), molecular cloning and disease diagnosis and treatment. The present sequence was used in a demonstration
                                                                                                                                Determining the nuclease stability and relative binding affinity of an oligomeric compound comprises capillary gel electrophoresis using
                                                                                                                                                                                                                                                                                                                                                                                                     Cleavage of nucleic acids from solid supports assay oligonucleotide #3
                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detaching nucleic acid molecule comprising unconventional nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          providing a sample comprising a number of oligomers of formula (1); (b) contacting the sample with a deprotecting agent to remove R t groups from the oligomers; and (c) reacting the oligomer with a cleaving reagent. The method is used to produce oligomer compounds for use in antisense and oligonucleotide therapies. The method enables the synthesis of
                                                                                                                                                                                                                      from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, cDNA and template preparation, DNA-based assays, mutagenesis procedures, mucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Guzaev A;
                                                                                                                                                                                              The present invention is concerned with the cleavage of nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel synthetic method (M) comprising: (a)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phosphorothioate; primer; oligomer synthesis; antisense therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel method for the production of oligomers with reduced exocyclic adducts comprises treatment with deprotecting and cleaving reagents
incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to aminooxy-modified nucleosides and oligonuclectides and to oligonuclectides that elicit RNase H for cleavage in a complementary nuclect acid strand. It also relates to oligonuclectides wherein at least some of the nucleotides are oligonuclectides wherein at least some of the nucleotides are include a substituent that potentiates hybridisation of the nucleotides oligonuclectide to a complementary strand, and at least some of the nucleotides include a 2'-deoxy-erythro-pentofuranosyl sugar moiety. The inclusion of one or more aminooxy moieties in such oligonuclectides provides for improved binding of such oligonuclectides to a complementary strand. The oligonuclectides of the invention are used as diagnostic, therapeutic or research reagents, and can be used to modulate gene expression in organisms. The oligonuclectides containing the modified nucleosides have increased nuclease resistance and increased binding
oligomers with a reduction in the number acrylonitrile groups attached. Acrylonitrile has been demonstrated to be a potent carcinogen in rats. This sequence represents a phosphorothioate 20-mer primer which is used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                           a

The specification describes oligomeric compounds containing 2'-0-modified ribosyl nucleosides. The 2'-0-modified nucleosides include ring structures that position the sugar moiety of the nucleosides preferentially in 3' endo geometries. The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel 2'-O-aminoethyloxyethyl modified nucleosides and oligonucleotides used in diagnostic, therapeutic and research reagents -
affinity to a complementary strand. The present sequence represents an oligonucleotide containing nucleotides substituted with a 2'-0-{2-[N-(2-amino)ethyl-N-(methyl)]aminooxyethyl} group.

The oligomeric compound contains phosphodiester linkages. The 2'-O-modified nucleosides include ring structures that position the sugar moiety of the nucleosides preferentially in 3' endo geometries. The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic, therapeutic and research reagents.
                                                                                                                                                                                  2'-0-modified ribosyl oligonucleotide with phosphodiester linkages.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                    This sequence represents a modified oligonucleotide used in the courtet invention. The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages wat least 1 nucleotide is linked to adjacent nucleotide by a 2',5' internucleotide linkage and bears a 3'-substituent. The oligonucleotides can be used in gene therapy and are also useful in antisense methodologies, diagnostics, therappeutics and as research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

The present invention relates to a method for preparing phosphorothioate oligonucleotides having at least one nucleoside with a 2' modification. The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nequence with a 2' modification in an acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; RNase H type II; RNase H1 cleavage substrate; antisense therapy; gene therapy; primer; phosphorothicate backbone; ss.

The invention relates to oligonucleotides comprising nucleotides covalently linked to pether by internucleotide linkages where at least 1 nucleotide is linked to adjacent nucleotide by a tleast 1 nucleotide linkage and bears a 3'-substituent. The oligonucleotides can be used in gene therapy and are also useful in antisense methodologies, diagnostics, therapeutics and as research

                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                      The present invention provides a number of DNA-RNA oligonucleotides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense therapy;

The present invention provides a number of DNA-RNA oligonuclectides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric oligonucleotides that can serve as substrates for human RNase
H1, useful for enhancing the effectiveness of antisense gene therapies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for treating disease caused
or diagnosing and treating
                                                             The present invention relates to nucleotide oligomers comprising monomer units. Oligomers modulate gene expression when hybridized by single- or double-stranded nucleic acid. They are useful for gene therapy, diagnostic and investigative purposes.
                                                                                                                                                  Gaps
        Guanidinium functionalized oligomers prepared from corresponding monomer units, are hybridizable with a specific RNA or DNA sequence, useful for diagnostic and therapeutic purposes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to C3' methylene hydrogen phosphate oligomers. The oligomers may be used as research reagents, for treating disease caused by undesired production of proteins and for diagnosing and treating AIDS and atherosclerosis.
                                                                                                                                                  ..
                                                                                                                                                                                                                                                                                                     DNA/RNA hybrid; oligomer; C3' methylene hydrogen phosphate; AIDS; atherosclerosis; ss.

The present sequence is a modified oligonucleotide.

2. -O-acetamido-modified nucleosides were used to produce oligonucleotides
which have enhanced nuclease resistance and superior hybridisation
properties than prior art. The oligomeric compounds are useful for
identification or quantification of ribonucleic acid and deoxyribonucleic
contidentification or quantification of ribonucleic acid and deoxyribonucleic
contidentification or quantification of ribonucleic acid and deoxyribonucleic acid molecule. They have a modified nucleoside monomer
and are specifically hybridisable with a preselected nucleotide sequence
contidential molecule. The oligomers are further useful in a
case useful in abnormal cell proliferation and tumour formation and
are useful in abnormal cell proliferation and tumour formation and
modification of expression of protein kinase C and cell adhesion
concludes such as ICAM. They are useful in the modulation of proteins
concluded to multidrug resistance and viral genomic nucleic acids such as

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.
       Dihydroxy sugar moiety, 2'-0-alkyl nucleotide, hybridisation affinity, nuclear resistance, alkylation, therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity, nuclear resistance, alkylation, therapeutic, diagnostic, ss.
                                                                                                                                                                                                                                                                                                                                                                                                      Alkylating 2' position of 2',3'-dihydroxy sugar molety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide #3 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a novel method of selective alkylation of 2. 3. dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive seter: The method is useful for the preparation of 2. O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                        The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of a ligonomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Dihydroxy sugar moiety; 2'-0-alkyl nucleotide; hybridisation affinity; nuclear resistance; alkylation; therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                         Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligomucleotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dibydroxy sugar moiety, 2'-0-alkyl nucleotide, hybridisation affinity, nuclear resistance, alkylation, therapeutic, diagnostic, ss.
                                                                                                               Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with seter -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with mucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, disgnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.

used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester position of 2',3'-dihydroxy sugar moiety of Alkylating 2'

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear registance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.

The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                        Dihydroxy sugar moiety; 2'-O-alkyl nucleotide; hybridisation affinity; nuclear resistance; alkylation; therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester -

The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprofic solvent, cooling, treating with base, warming, cooling and reacting with ester
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ..

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of 6 ligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention.
                                                                                                             /mod_base= OTHER
/note= "2'-dimethylaminooxyethyl thymidine (T-2'DMAOE)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dihydroxy sugar moiety, 2'-O-alkyl nucleotide, hybridisation affinity, nuclear resistance, alkylation, therapeutic; diagnostic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligonucleotide #23 used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with base, warming, colling and reacting with nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligomucleotide used to illustrate the method of the invention.
                                                                                                                                                                                             /mod_base= OTHER

The invention relates to detecting mutations in the BRCA1 and hMLH1 gene comprising subjecting a set of amplification products to two-dimensional DNA electrophoresis (TGDS) to produce a characteristic spot pattern for a specific mutation in either the BRCA1 or the hMLH1 gene.

Also included are test kits for enabling BRCA1 or hMLH1 gene testing comprising short PGR primers given in the specification, mixed in 20 mM of Tris-HG1, 50 mM kG1, 25 micro M of GNTP, and 5 % formande.

The method is useful for detecting mutations in the BRCA1 (breast and ovarian cancer susceptibility gene, a tumour suppressor gene) and hMLH1 gene (a DNA mismatch repair gene). The present sequence is a PCR primer specific to hMLH1 used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying and detecting nucleic acids, particularly DNA hybridization probes, involves employing chain extending enzymes (e.g. telomerase) to elongate probes to render them readily detectable
Detecting mutations in the BRCA1 and hMLH1 gene comprises subjecting amplification products to 2-dimensional gel electrophoresis to produce a characteristic spot pattern for a specific mutation in either the BRCA1 or the hMLH1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tailing reaction related exemplary primer biotin-dT18U SEQ ID NO:1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              reaction; tailed primer; primer; probe; identification; on; linear amplification scheme; chain extending enzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;
                                                                                                                                                                                                                                                                                                                        The present invention relates to a novel method of selective alkylation of 2.'3'-dihydroxy sugar molecties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive seter. The method is useful for the preparation of 2'-0-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The presett sequence is a modified oligomucleotide used to illustrate the method of the invention.
                                                                                                                                                                                                             Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester -

The present invention describes a method for detecting a nucleic acid probe, which comprises using chain extending enzymes to elongate probes. The method comprises (a) tracting the sample with a chain terminating reagent to prevent polynuclectide chain growth from the nucleic acid in the sample; (b) contacting the sample with the probe containing a termination of termina capable of elongation by a chain extending enzyme, where the probe hybridises to the nucleic acid in the sample; (c) contacting the sample with a chain extending enzyme and its substrates, which elongates the probe; and (d) detecting the elongated hybridised probe. Also described is a method comprising: (a) treating nucleic acid molecules or modified nucleic acid in a sample with a reagent or reagents that render the nucleic acid chains unextendable by a non-template-dependent enzyme; (c) hybridising the treated molecules with a nucleic acid probe that includes an extendable terminus, under conditions where hybrids form; and (c) treating any hybrids formed with a nucleic acid archain that the chain where hybrids form;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        elongating enzyme and its substrates, where any hybridised probe is extended. The method is useful for identifying and detecting nucleic acids, particularly DNA hybridisation probes. The present sequence represents a talling reaction exemplary primer, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2'-O-alkyl oligonucleotide; nuclease resistance; diagnosis; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          P
                                                                    The present invention describes a method for detecting a nucleic acid probe, which comprises using chain extending enzymes to elongate probes. The method comprises: (a) treating the sample with a chain terminating reagent to prevent polynucleotide chain growth from the nucleic acid in the sample; (b) contacting the sample with the probe containing a terminating capable of elongation by a chain extending enzyme, where the probe hybridises to the nucleic acid in the sample; (c) contacting the sample with a chain extending enzyme and its substrates, which elongates the probe; and (d) detecting the elongated hybridised probe. Also described is a method comprising; (a) treating nucleic acid molecules or modified nucleic acid comprising; (a) treating nucleic acid molecules with a nucleic acid molecules or the nucleic acid chains unextendable by a non-template-dependent enzyme; (b) hybridising the treated molecules with a nucleic acid probe that includes an extendable terminus, under conditions where hybrids form; and (c) treating any hybrids formed with a non-template dependent chain catended. The method is useful for identifying and detecting nucleic acids, particularly DNA hybridisation probes. The present sequence acids, particularly DNA hybridisation probes. The present sequence represents a tailing reaction exemplary primer, which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;·
                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a chimeric oligonucleotide having some 2'-methyl thioethyl modifications. This was compared with coligonucleotides with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951) modifications for resistance to snake venom phosphodiesterase. The assay revealed the nuclease resistance of the modified oligomers. The invention provides methods for the alkylation of alcohols, amines, thiols and their derivatives by cyclic sulfate interndiates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of nucleosides and their analogues with cyclic sulfates to form the 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-sulfate sand their analogues. The methods are especially useful for the preparation of for are precursors for the preparation of oligomeric compounds useful are therapeutics, diagnostics and research reagents.
                                                                                                                                                                                                            miny action or alcohols, amines, or thiols, useful for preparing nucleosides that are precursors for preparation of oligomeric compounds beneficial as therapeutics, involves use of cyclic sulfate intermediates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2'-0-alkyl oligonucleotide; nuclease resistance; diagnosis; therapy;

The present sequence is that of a chimeric oligonucleotide having some 2'-methoxyethoxy modifications. This was compared with coligonucleotides with methyl thioethyl (see ABA9191949) and dimethylaminopropyl (see ABA91951) modifications for resistance to snake venom phosphodiseterase. The assay revealed the nuclease resistance of the modified oligomers. The invention provides ceristance of the modified oligomers. The invention provides contactives by cyclic sulfact intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of the 2', 3' or 5'-hydroxy position of corn the incleosides and their malogues with cyclic sulfates to form the Displacement of the 2', 3' or 5'-O-sulfate with a nucleophile compounds are disclosed. Displacement of the 2', 3' or 5'-O-modified nucleosides and their analogues. The methods are especially useful for the preparation of the 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates that are precursors for the preparation of oligomeric compounds useful
                                                                                                                                                                                                                                                                                                                                                                                 Alkylation of alcohols, amines, or thiols, useful for preparing nucleosides that are precursors for preparation of oligomeric compounds beneficial as therapeutics, involves use of cyclic sulfate intermediates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of a chimeric oligonuclectide having some 2'-dimethylaminopropyl modifications. This was compared with cligonuclectides with methyl thioethyl (see ABA91949) and methoxy (see ABA91950) modifications for resistance to methoxy (see ABA91950) modifications for resistance to resistance of the modified oligomers. The invention provides resistance of the modified oligomers. The invention provides of the modified oligomers. The invention provides for the alkylation of alcohols, amines, thiols and their derivatives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of nucleosides and their analogues with cyclic sulfates to form the Displacement of the 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-sulfate with a nucleophile control size especially useful for the preparation of are precursors for the preparation of oligomeric compounds useful as therapeutics, diagnostics and research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alkylation of alcohols, amines, or thiols, useful for preparing nucleosides that are precursors for preparation of oligomeric compounds beneficial as therapeutics, involves use of cyclic sulfate intermediates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The method can be used to detect interactions between nucleic acids, antigens and antibodies or receptor and ligands, particularly in applications such as medical diagnossis, foremist science, bacterial screening, tissue typing transplantation, monitoring gene expression, and genotyping. The present sequence is a modifying oligonucleotide used in the exemplification of
                                         Parget detection; quantitative analysis; probe; medical diagnosis;

The invention relates to novel nuclease-resistant oligomeric compounds. The compounds of the invention are useful as pharmaceuticals for topica administration such as transdermal patches. The oligomeric compound is resistant to enzymatic degradation. The sequences shown in ABZ75345-ABZ75399 represent the nuclease-resistant compounds of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel muclease-resistant oligomeric compounds. The compounds of the invention are useful as pharmaceuticals for topical administration such as transdermal patches. The oligomeric compound is resistant to enzymatic degradation. The sequences shown in ABZ75345-ABZ75399 represent the nuclease-resistant compounds of the

                                                                                                                                                                                                                                The present sequence is an example of an oligonucleotide of the invention containing 2'-O-(2-(methylthio)ethyl)-5-methyluridine (2'-O-(MTB)-5-methyluridine) modifications. In examples of the invention, 2'-O-WTB was incorporated into oligonucleotides and evaluated for antisense properties in comparison with the known 2'-O-(2-methoxyethyl) (2'-O-MOB) modification. The 2'-O-MTB modified oligonucleotides exhibited similar binding affinity to target RNA as their 2'-O-MOB equivalent while binding to human serum albumin was improved. The modification can be used to modulate the pharmacokinetics of oligonucleotides, e.g. in
                                                                                                                 Increasing binding of oligomeric compound to proteins useful in preparation of antisense therapeutics, involves use of modified oligomeric compound having oligonucleotide group
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (AC)15 and a (FC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (F6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                    nucleotide, it can be used in the synthesis of DNA and RNA nucleosides, nucleotides and oligonucleotides and for the synthesis of opposite strands in the presence of a template strand and in fluorescence microscopic and macroscopic detection in vivo and in vitro of genetic material. It is labelled with a fluorescent dye. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding.
                                                                     The sequence is an example of a dye coupled 3'-amino modified oligo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding
